WHISPER RING®

# Marcel Clerx

CEO Mega Windforce Group BV

The future of wind energy

# The future of wind energy
# How innovation will drive down the cost of wind energy

MEGAWINDFORCE
Redefining wind energy

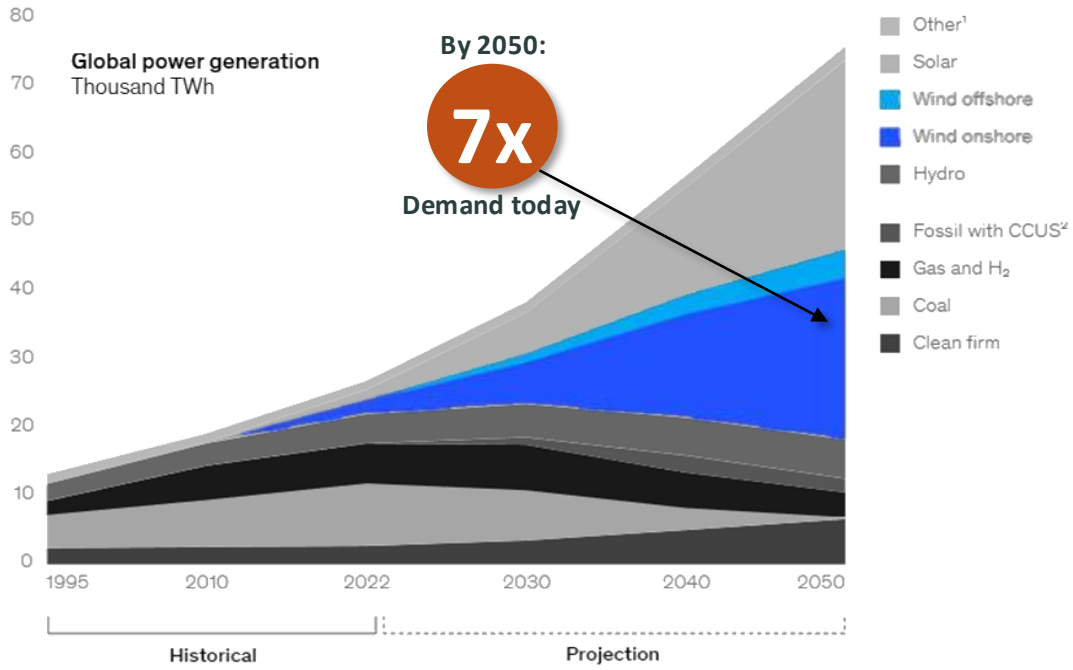

MEGA WINDFORCE INTRODUCES WHISPERRING®

*September 29th 2026*

## Renewable energy demand sees explosive growth by 2050

Climate change requires decarbonization of energy

Wind energy projected to grow by factor of **7**

Source: McKinsey Global Energy Perspective 2024

## To beat fossil fuels, we need innovative wind energy solutions

Rising costs, uncertain supply chain caused by geopolitical risk

Frequent maintenance leads to downtime and increased OpEx

Large financing costs of wind causes risk-averse sector

MEGAWINDFORCE
Redefining wind energy

# The WhisperRing wind turbine makes low-cost wind energy abundantly available

## Very low cost of energy

*30-50% lower LCoE[1]*

- WR20kW turbine with targeted LCoE of ~100 €/MWh in Class II wind regime
  *-> Existing similar turbines 200€/MWh and higher*
- Larger turbines (WR36-500kW+, WR72-3MW+) with targeted LCoE 20-25 €/MWh
  *-> Traditionally 35-50 €/MWh[2]*

## Flexible production scaling with excellent business case

- Production facilities can quickly scale capacity for all models to meet demand in different markets
- Low up-front investment for production capacity
  *Payback period < 3 years*
- Excess production capacity can be used to produce other high value carbon products

## High suitability for ESG[3] goals

- European developed product: Dutch design, German technology
- Reduced reliance on scarce resources
- Suitable for locations with height restrictions
- Low noise emissions & fewer bird mortalities
- Energy efficient, low waste and low CO2 carbon production process

[1] *LCoE: Levelized Cost of Energy – lifetime cost per unit of energy in €/MWh*
[2] *NREL 2024 Cost of wind energy at https://docs.nrel.gov/docs/fy25osti/91775.pdf. Comparison with 130m rotor diameter, so advantage of WhisperRing is larger*
[3] *ESG: Environmental, Social and Governance*

4

Can you give examples of experiments or prototypes that changed your original assumptions or made you substantially change the solution?

# WR20kW

Rotor: 10m | Hub height: 12-30m | Capacity: 20 kW

## NETHERLANDS

LCoE
**€104/MWh**

AEP[1]
**46 MWh**

*(estimated for Schiphol)*

## SCOTLAND

LCoE
**€65/MWh**

AEP
**74 MWh**

*(estimated near Inverness)*

## GREECE

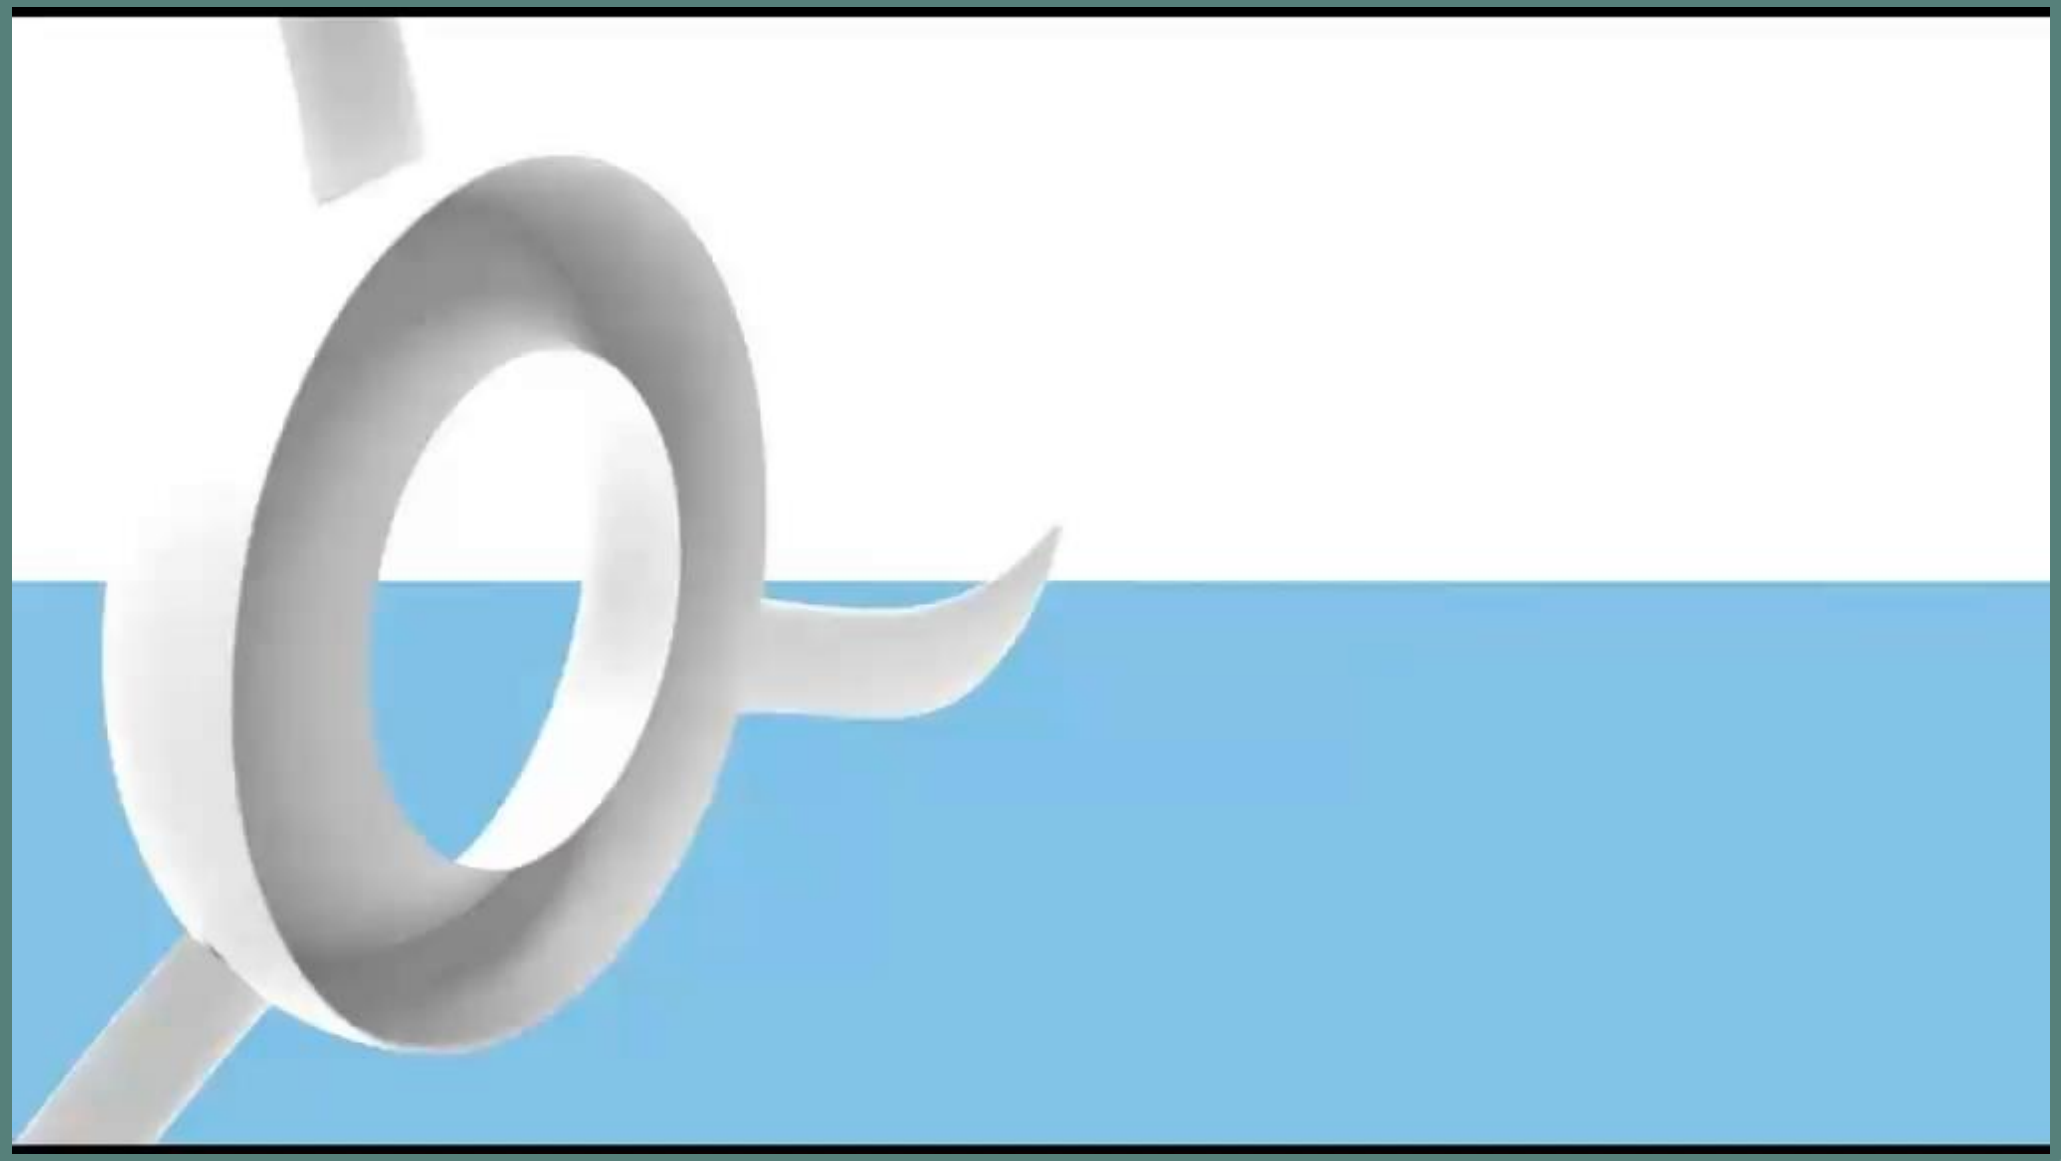

LCoE
**€76/MWh**

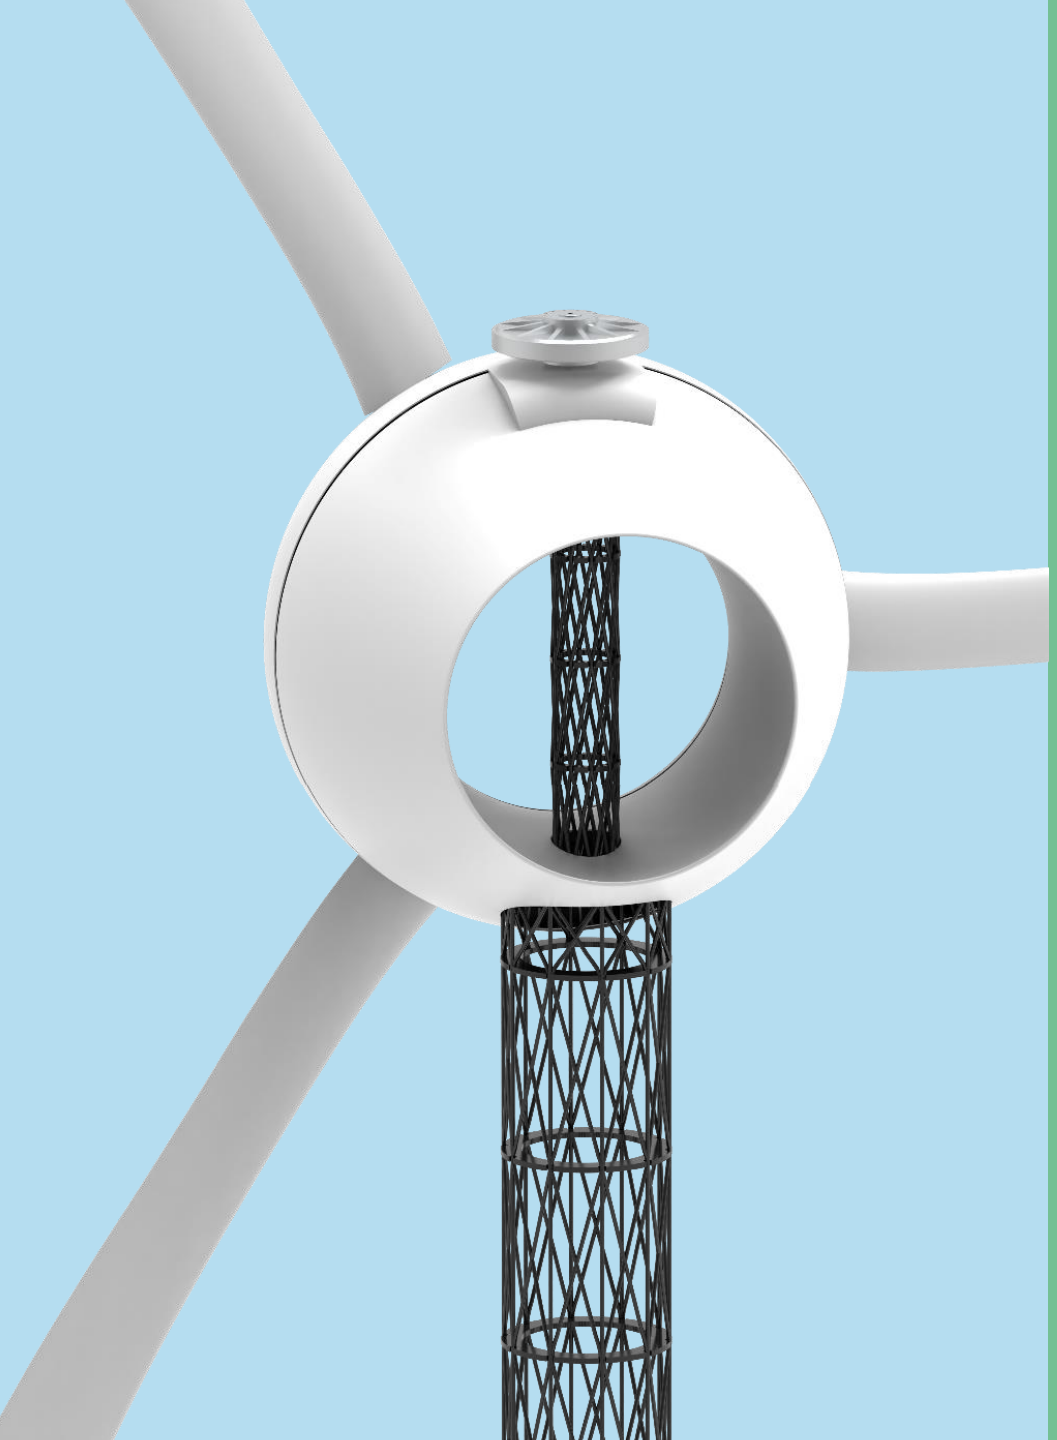

AEP
**63 MWh**

*(estimated for Andros)*

[1] AEP = Annual Estimated Production.

# How to deal with stronger wind regimes?

# **Mega Windforce introducing: WhisperRing**
## Innovative design, revolutionary materials

- Ring design allows **highly effective generator** with low use of magnet material
- **Low weight** due to CFRP[1] use, low use of magnetic material and absence of gearbox
- Airfoil-shaped ring **yields top-tier energy conversion**
- Superior aerodynamic design leads to **less wake** allowing turbines to be built **30% closer together**
- Tower with lattice structure **reduces weight** and **aero forces** on structure

**Core innovations secured by 2 patents**

[1] *CFRP: Carbon Fiber Reinforced Polymer*

MEGAWINDFORCE
Redefining wind energy

How can you test an idea when the actual product is still expensive, technically difficult, or simply does not exist yet?

How do you test whether potential customers actually value a solution, rather than merely saying that they like the idea?

What are useful ways of conducting early market tests and getting meaningful customer feedback?

| Focus markets | WhisperRing market potential | Go-to-market strategy |
|---|---|---|
|  Greece | • Excellent wind regime on **6000+ islands**<br>• Frequent very high energy prices – **€250-600/MWh**<br>• Many islands dependent on **polluting diesel generators**<br>• Potential partner estimates **3000+ turbines** market<br>*Drawbacks*:<br>• Higher transport costs than closer markets | • Partnership with Greek distributor with 1.5GW sustainable energy portfolio – **LoI received** |
|  Turkey | • **Favorable government stance** on wind energy with incentives<br>• Strong manufacturing/supplier base for **clean technologies**<br>• High **rural/offgrid** energy demand<br>• Excellent wind regime in **coastal areas**<br>*Drawbacks*:<br>• Higher transport costs than closer markets | • Seek partnerships with local manufacturers/distributors |
|  The Netherlands | • **Farmers**: estimated 12k farmers potential customers[1]<br>• **Energy hubs**: 1200 hubs suitable for multiple WR turbines[2]<br>• **Solar parks/roofs**: 20 GW installed at 12000 locations[3] in windy provinces in NL – suitable for cable pooling<br>*N.B. partial overlap with Dutch farmers mentioned* | • Discussing sales partnership with various parties (ProfiNRG, Full Power Support, LTO)<br>• Seek partners for hybrid energy generation with PV |
|  United Kingdom | • **High energy costs** for end users, e.g. ~250€/MWh for SME[4]<br>• **Favorable government stance** for small wind turbines<br>  • Low permit burden<br>• Grid restrictions in **many rural locations** | • Partnership with Scottish Development International<br>• Expand to rest of UK in 2nd phase |

How do you deal with uncertainty when you do not yet know whether an idea, technology, or market will work?

How do you decide "what to test first" instead of immediately investing in developing the full solution?

What role have prototypes, pilots, experiments, or minimum viable products played in your entrepreneurial journey?

# Proof of concept & WR20kW powertrain have been developed

**WR2.0: Proof-of-concept**

*Fully functional with 2m rotor*

**WR20kW Power train**

*Bearing system & generator*

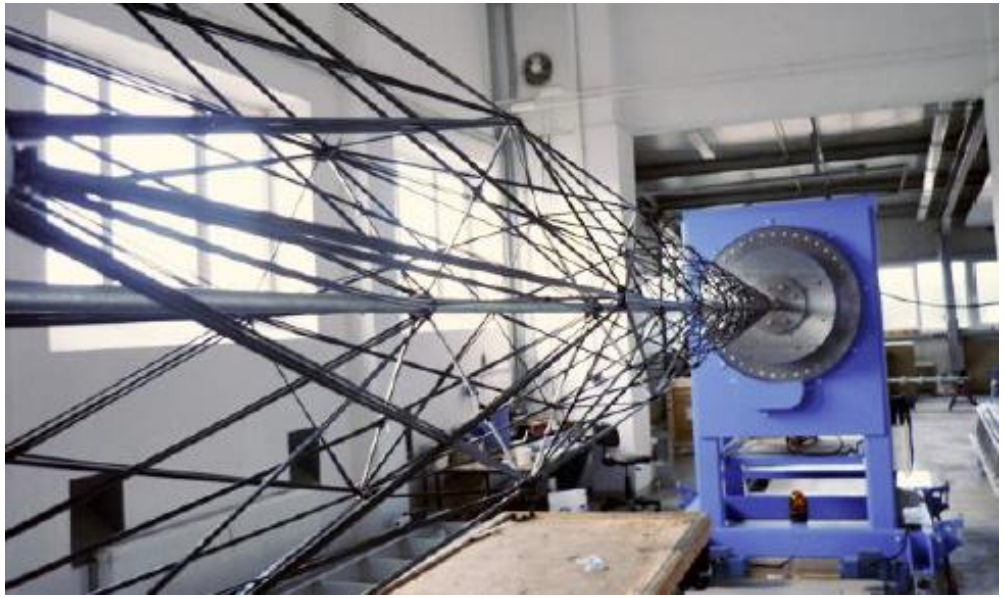

# Patented CFRP production process…

CFRP: carbon fibre reinforced polymer

R&D partner developed technology with the Fraunhofer Institute – Mega Windforce fully licensed for use in wind industry

Derisking opportunity to use excess factory capacity for turbine parts sales

Laying of resin penetrated fibre rovings on nodes to produce complex 2D and 3D structures of any size

# ..offers significant competitive advantage

- Fully automated cost-efficient technology
- Low-energy, waste free production
- Improved integration compatibility with e.g. metallic structures
- High and reproducible quality
- Modular manufacturing
- Very high fatigue strength & reduced material use → increased durability

MEGAWINDFORCE
Redefining wind energy

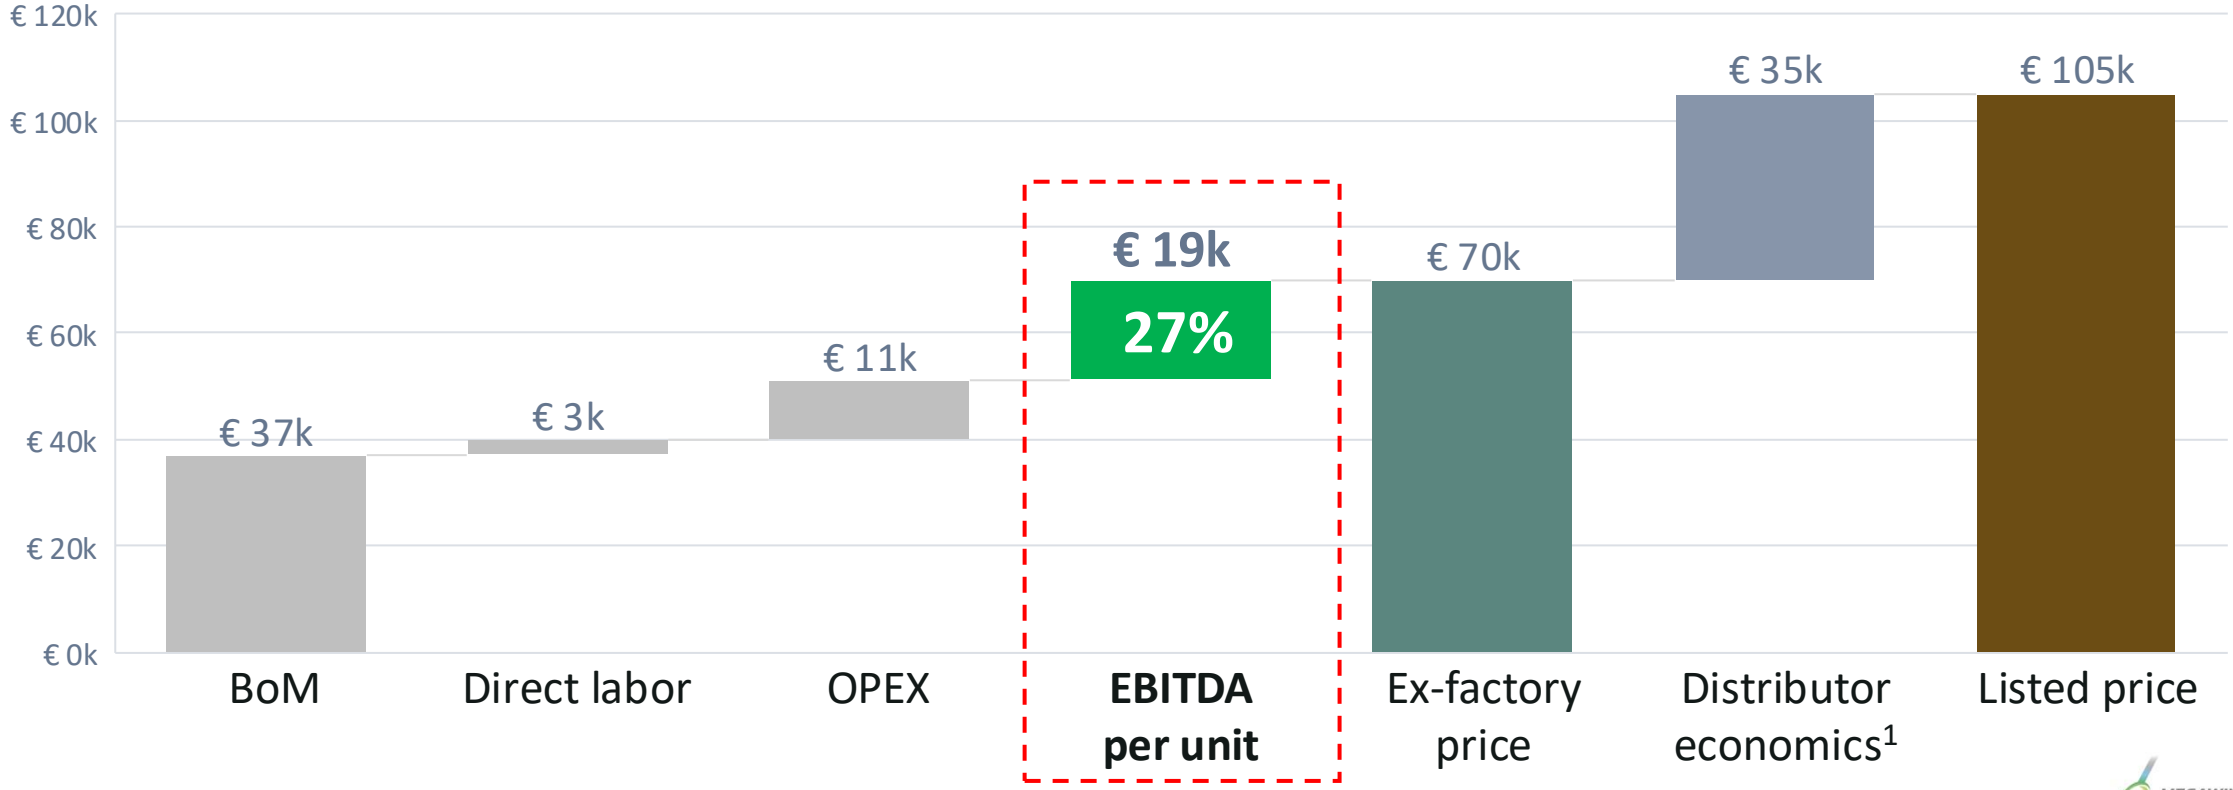

# WR20kW factory yields €21M EBITDA on €10M investment after ramp-up

€19k EBITDA per unit ✖ 1125 units / year = **€21M EBITDA**

**On €10M investment**

*€6M equipment*

*€4M working capital*

*Assuming factory at 75% capacity. Prices inflation adjusted for 2029, forecasted end of ramp-up*

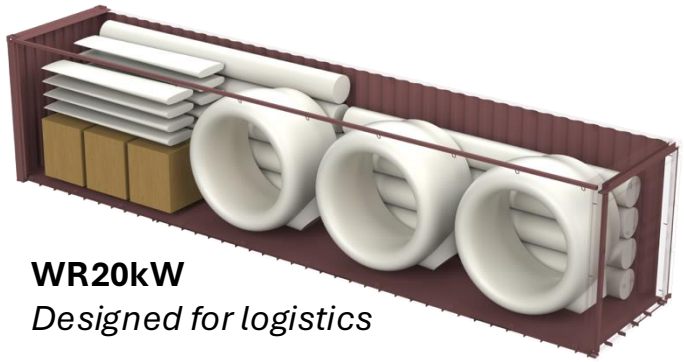

*[1] Includes distributor margin & costs*

Can you give examples of experiments or prototypes that changed your original assumptions or made you substantially change the solution?

# Mega Windforce is finalizing preparation to scale up to mass production & sales

**€10M investment**

- Equipment supplier lined up
- All required IP present
- Full overview of required staff, tooling, equipment finalized

**WR20kW**
*Designed for logistics*

**Ecosystem**

- Partnership with relevant players in ecosystem:
  - Production technology partner
  - Composite suppliers
  - Electrical suppliers
  - Logistics partners
  - Distributors
  - Service suppliers

**Markets**

- 3 focus markets lined up
  - Greece – LoI signed for 3000 turbines in next 5yrs
  - Turkey – MoU for production partner & distributors
  - Scotland (& UK) – TAM of 20.000 units

MEGAWINDFORCE
Redefining wind energy

How do you decide when you have learned enough to iterate, pivot, stop, or scale up?

## Teamwork makes the dream work

Experienced team combining renewable energy, engineering and scale-up expertise to successfully develop and scale the business. All key C-level responsibilities are fully covered, ensuring strong leadership across every critical function.

**Eric van der Gun - CCO**
*Seasoned entrepreneur renewable energy*

**Marcel Clerx – CEO**
*Veteran entrepreneur & expert in scaling innovation*

**Wessel van der Deijl - Engineer**
*PhD in experimental aerodynamics and turbine design*

**Roland Luijendijk – IP Expert**
*Experienced tech investor & IP strategist*

**Remco van der Sluis – Marketing & branding**
*Entrepreneur and experienced scale-up coach*

**Niels Diepeveen – Tech Advisor**
*PhD in wind turbine tech & expert on R&D and deployment*

**Gerard van Noort - CTO**
*Entrepreneur and expert in renewables & energy markets*

**Reinoud Blom – COO**
*Energy transition strategist*

**Dylan Eijkelhof – Engineer**
*PhD in wind turbine tech & lightweight design*

**Bas Buijzen – Investor relations & governance**
*Investor in renewable energy innovations*

**Johan Overtoom – Marketing & Communication**
*MarCom veteran with technology track record*

**Wessel Kruidenier – Investment Manager**
*Aerospace Engineer with expertise in investment analytics and financial modelling*

## Roadmap to commercial scale

First WR20kW sales in 2027

**TODAY**
*June 2026*

- **Proof-of-concept built**
- **Power train developed**
- **All proven technology, protected by multiple patents**

**€2.5M funding**

**12 months from now**

- **WR20kW prototype built, validated & certified**
- **Optimized for mass production**
- **Factory setup underway**

| | | TRL[1] |
|---|---|---|
| **2025** | **DEVELOPMENT** | |
| | WR2 Prototype<br>WR20kW Powertrain | 6 |
| **2026** | **VALIDATION** | |
| | WR20kW Prototype<br>WR20kW Preproduction series | 7<br>8 |
| **2027** | **SCALE UP** | |
| | Start WR20kW production<br>Scaling to 1500/yr | 9 |
| **2028** | **EXPANSION** | |
| | Start prototype WR36-500kW+ | 7 |
| **TBD** | **PIPELINE** | |
| | Prototype WR72-2MW+, WR90-3MW+ | |

[1] *TRL: Technology Readiness Level*

Looking back, what would you advise students to prototype and test before spending substantial time or money on developing their idea?

Key take-away's

1. Include customers right from the start
2. Include field installation and maintenance partners right from the start
3. Build a prototype fast, then experiment, so the market gains trust on your progress
4. Start business development in the market parallel to prototyping and experimenting
